White 1689.

A New

ALMANÁCK

For the year of our Lord God

1689.

And the year from the Worlds Creation, 5638.

Being the first from the Bissextile, or Leap-year.

Calculated for the Meridian of *Todington* in *Bedfordshire*, where the North Pole is elevated above the Horizon 52. degrees and 8. minutes; and may serve for all parts of *England*, without any sensible error.

By Tho. White.

Cœli enarrant gloriam Dei, & opera manuum ejus annunciat firmamentum, Psal. 19. 1.

Cum Privilegio.

TO Measure Timber and Board, the ordinary Way now used amongst Carpenters in the Country, is by the Line of Numbers, commonly called *Gunter's Line.*

Board-Measure.

As 12 is to the breadth in Inches: so the length in Feet, to the content in Feet.

Squared Timber 14 Inches on both sides, or any other equal *Square.*

As 12 Inches is to 14 Inches the breadth or side: so the length in Feet, to a fourth Number; and that fourth Number extended to the content in Feet.

A *Square* 14 Inches one side, and 9 Inches the other side, or any unequal *Squared* Timber.

As 12 Inches is to 9 Inches the breadth: so the depth 14 Inches to a fourth Number.

As 12 to this fourth Number, so the length in Feet to the content in Feet.

Round Timber.

As 42, 54, (the Circumference in Inches that makes 1 Foot long, a Foot.) Is to the Circumference in Inches. So the length in Feet, to a fourth Number, and that fourth, to the content in Feet being extended.

But the usual way with Carpenters, is to girt about the middle, and take a fourth part thereof for the *Square*, and then measure it as *Squared* Timber by the Line. Note, that if the Compasses come off the Line, they must be set at the same point, on the Line at the other end of the Ruler; and always keep them forward the same way, &c. according to the Proposition.

This Table shews the Interest of any sum of Money from 1 *s.* to 100*l.* from a day to a year. And by the help of Addition you may compute the Interest of any sums whatsoever. And note, that for the greater exactness the peny is divided into 100 parts; so that 25 parts are a farthing, and 50 parts an half-peny, and 75 parts 3 farthings, &c.

Example.

The Interest of 100 *l.* for six months one week and one day, is thus found by the Table.

The Use and Explanation of this TABLE.

The first Column towards the left hand, sheweth the Years of a Lease or Annuity, and right against each Year, is the Years, Months, and Decimal Parts of a Month's Purchase, that such a Lease or Annuity is worth.

EXAMPLE.

Suppose a Lease or Annuity to continue ten Years, and you would know how many Years Purchase it is worth in present Money, look in the Table for ten Years of a Lease to the left hand, and against the same you shall find 7, 4, 3; which sheweth such a Lease to be worth seven Years, four Months, and three tenth Parts of a Month's Purchase.

Again, Are you take or buy the Reversion of any Lease or Annuity, work thus: Suppose the Lease to be thirty Years in all; you find in the second Table, and right hand against thirty, 13 Years 8 Months, and two tenth parts of a Month's Purchase; this it were worth, were it in present possession. But suppose there be a Lease of five Years (more or less) before yours commence; look in the Table against the five Years, and there you find four Years, two Months, five tenth parts, half a Month's Purchase; take this out of the sum against thirty, which is 13, 9, 2; 4, 2, 5; the remainder is nine Years six Months, seven tenth parts of a Month; and so much is the Reversion after five Years worth, the remainder of thirty Years. This is useful and very easie.

To

To Measure Land by the Chain of ten Links to the Pearch.

I Understand that many honest Country-men, could Measure small Closes or pieces of Land, by casting them into Triangles or Squares, if their lengths, breadths, or perpendiculars would happen to be in even Perches, but if they have odd links in them, then they do not understand the way how to cast them up; therefore I will shew them how they shall perform the same.

Suppose there be a Close or piece of Land 35 Perches and 7 Links long, and 24 Perches and 6 Links broad, Multiply 35.7. the length, by 24.6 the breadth, as if they were whole Numbers, with a prick between the Perches and Links, and the product thereof will be 87822, which two last Figures in your product you must cut off, with a dash of your Pen, which are 22 square links towards another Perch, there being in one Perch 100 sq a e links; the 878 in your product are Perches, and if the 878 be divided by 40, the Quotient will be 21, which are Roods, and 38 Perches, which long square doth contain 5 Acres 1 Rood, 38 Perches, and 22 square Links.

Example of the Multiplication.

If your length or breadth to be multiplied, were one of them given in Perches, the other in Perches and Links, then from the product thereof, you must cut off but one Figure, which one Figure will shew, so many tenth parts of one Perch. And if the length or breadth to be mutiplied happeneth to have a half Link in either of them, thou mayest remember, that half a Link in breadth, through every twenty Perches in length, maketh one Perch of Land, which thou mayest add to thy product, &c.

Although there be several kinds of Triangles, I will therefore add one Example for all which is general, Half the length of the Base being Multiplied by the length of the Perpendicular, shall be equal to the Area of the Triangle.

Or half the length of the Perpendicular being multiplied by the whole Base, will be the content of the Triangle.

If a Close or piece of Land be broader at one end than at the other, add both the ends together, and take the half thereof for the breadth, which multiplied by the length, the Product sheweth the true Content.

England containeth 29568000 Acres.
Scotland containeth 14432000 Acres.
Ireland containeth 18000000 of Acres.

The 17 Provinces of the *Low Countries* contain in the whole, 10791000 Acres; whereof those under *Spain*, 7197000 Acres.

Those *United* under the States, 3599000 Acres.

France in its 32 Provinces containeth 82879000 Acres.

The Explanation of the following Table.

First, get a Chain or Cord of two perches in length, and divide each perch into 10 equal parts, which I call links, each of those parts will contain 19 inches and 8 parts of one inch: the inch divided into 10 parts, 10 of those links makes 16 feet and an half, our common perch ſtatute-meaſure: 100 ſquare links makes one perch of land, 40 ſquare perches make one rod, 80 half an acre, 120 three rods, and 160 ſquare perches one acre.

This following Table doth contain 5 Columns: The firſt Column on the left hand ſheweth the length of the Acre in perches and half perches; the figure of 5 under every length, ſignifieth 5 links, or half a perch forward: The other four Columns ſhew the breadth for one Acre; the firſt Perches, the ſecond Links, the third Inches, the fourth Parts of one inch, the inch divided into 10 parts.

And alſo in this laſt Column in many places of this Table, you will ſee a ſmall Figure placed on the right hand of p, which is no more than one 10th part of an inch divided into 4 parts; and the true or neereſt part I have obſerved.

Example: At 13 perches in length, the breadth will be found 12 perches, 3 links, 1 inch, and 5 parts of an inch, and 1 part of a fourth; which is a quarter of a tenth part. At 13 perches and an half in length, which is expreſſed by the figure of 5 under 13, you will finde the breadth 11 perches, 8 links, 10 inches, 2 parts and 3 quarters.

The Explanation and Uſe OF THE MAP and TABLE.

FIrſt for the Map: The Figures in each Shire of the Map, are to ſhew you the names of every County, and the Letters in the ſame are for ſuch uſes as I will ſhew hereunder.

You muſt underſtand, that London is in Middleſex, which County of Middleſex hath the figures of 22 in it, and the little black ſpeck or ſpot therein, ſignifieth London. Now if you would readily finde the name of any Shire therein, and how many miles the middle of the ſaid County (in a ſtreight line) is from London, and what point of the Compaſs it lieth from the ſaid City, reſort then to the Table of Shires on the other ſide, and it will reſolve you.

As for Example:

Yorkſhire it hath the figures of 39 in the Map, and ſo it hath likewiſe in the Table; where is ſhewed that the middle or heart of that Shire is 145 Miles from London in a ſtreight line, and it lieth North from the City; and looking forward toward the right hand, it ſheweth it hath one City, Forty Market Towns, Fourteen Caſtles, Four hundred fifty nine Pariſhes, Thirty ſix Rivers, and Seventy two Parks; and ſo of the reſt.

The uſe of the Leters in the Map, is this:

Scotl. ſignifieth part of Scotland, I part of Ireland, F part of France, M the Iſle of Man, W the Iſle of Wight, L the Lizard-point, H Holy-head, the * the Iriſh-Sea, B the Britiſh or Engliſh-Sea, G the German-Sea, Ba Barwick, D Dover, N Newcaſtle, C the Points of Compaſs, S the Scale of Miles by which you may meaſure the diſtance of any place: for every black degree is five miles, ſo is every white.

The 39 Shires from Berkſhire to Yorkſhire are the Engliſh Shires, and the other 13 from Angleſey to Radnorſhire are Welſh.

It may be ſomething farther in Miles to the middle of each Shire, by reaſon of the crookedneſs of the High-ways, Hills, and Vallies; but what is here ſet down is meant in a ſtreight line from London.
